

The author structured his work in four parts in order to offer a systematic analysis of the victimization of illegal immigrants. The first part gives an introduction to the theme of international migration, by providing an historical and empirical overview. The second part is dedicated to the theoretical explanation of the empirical facts presented in the first part. The third part examines the reason for international migration and the reaction to it in European countries. In the last part of his 410-page tome, Kiza discusses the impact of the European Union's immigration policy, by emphasizing its effects on the migrants and, in particular, their victimization.

It is a pity that the author is hiding behind the abstruse jargon of much contemporary political science in order to do something very important: to understand the actions of the different actors in the European immigration policy and the very impact that this policy has on the refugees trying to enter Europe. There is no necessity describing the fact that the nation-state is the actor in the international system with a phrase like: *“Zum einen handelt es sich dabei um die Verfasstheit des internationalen Systems, die auf der Westfälischen Ordnung basiert und als zentrale Prämisse die Existenz souveräner Nationalstaaten postuliert. Somit ist der souveräne Nationalstaat der zentrale Akteur im internationalen System und nimmt daher eine zentrale Rolle bei der Beeinflussung und Formung internationaler Migrationsströme ein.”* (p. 17) What has the *Westfälische Ordnung* to do with migration, except sounding very academic?

Neil Postmann pointed out that that “elite trades — physicians, lawyers, teachers, and scientists — protect their special status by creating vocabularies that are incomprehensible to the general public. This process prevents outsiders from understanding what the profession is doing and why.” Postmann himself did not really oppose this; he saw it as a necessity. In this case, unfortunately, does the “technical gobbledegook” (Postmann) prevent the very people who should be interested in reading about it from getting the message.

It is not understandable why the author is hiding behind a technical language that makes the text inaccessible. It may be a sign of knowledge at the University of Kassel, where the author handed in his work, to be able to describe migration as an *“ubiquitäres biologisches Phänomen”* (p. 324), but for me as a reader it sounds just ridiculous. I still see the task of political science as to describe complex political phenomena in an understandable way, so as to provide politics with information and notions whereby to develop policy. It is a pity that the author did not make an effort to turn his PhD thesis into a readable text for its

publication as a book. The topic and all the hard work invested into the research would have deserved it.
